Final Project.

In this Project I would like you to create a web page for hotel reservations. You can use your own template creation based on any hotel template that you can find on the web. You can also use the template below as a reference of what I expect to see on the web page.
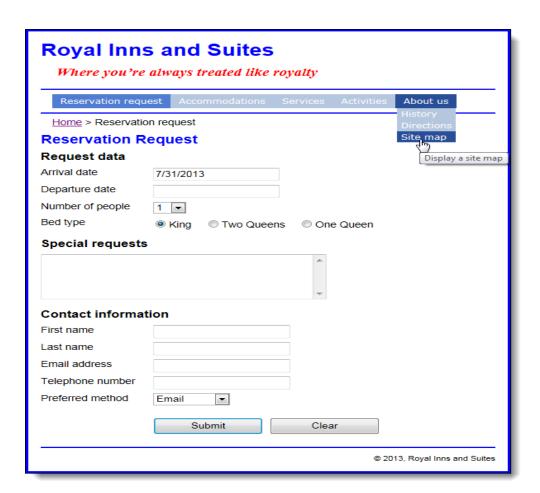

I am expecting you to apply on the web page most of the features we learn during the course that include and not limited to Master page, dropdown boxes, navigation menu, data box input validation, database control and so on.

The database table should list fields such as : Lastname, first name, age, State , address, arrival date, departure date, reservation number, number of people, type of bed, special request, email, phone number. Satisfy field (Yes, or No)

You can use external Microsoft access database or you can create a local SQL database file from within the project as seen in the course video (Week 12). You can insert a button to show a graphic chart of number of room reserved during a specific date Or the age and first name of customer. Or the customer State resident and first name and so on.

I expect to see a welcome confirmation email that needs to be sent to the customer with reservation number.(if issue with email submission, you can substitute by sending a message to a web form in the project that you will call confirmation page where you list the customer info.

You need to include on the main page a text box that will list the name of student who contribute to the project in your group. Good luck.
